Challenge

Managing the real-time inventory details of an organization in a Configuration Management Data Base (CMDB) is one of the challenges which organizations are facing. Our customer had a need for Inventory Management System, which can provide the details at the granular level automatically, whenever the terminal is connected to the network.

Solution

- ISS provided an Inventory management system which populates the CMDB whenever a terminal is connected to the network.

Benefit

- The CMDB was populated automatically with a little user intervention.
